Introduction

Alcoa Fastening Systems' (AFS) Recoil manufacturing operations are located in Australia, with sales and warehouse facilities strategically located in North America, Asia, and Europe. Extensive worldwide distribution, coupled with the company's manufacturing strategy, offers significant advantages to end users.

Alcoa Fastening Systems ensures a global consistency of quality design standards in manufacturing the full range of wire thread inserts in one production facility. Users around the world can be assured of high standards and the consistency of all AFS products.

Inserts are manufactured in standard sizes for all metric and inch thread forms. A comprehensive design facility is available to ensure that non-standard inserts can be manufactured for special part requirements.

Prompt availability of products to customers worldwide is ensured by an efficient international freight service and a network of stocking distributors.

Alcoa Fastening Systems is committed to the highest quality products and operating systems and employs a strict quality management system in accordance with:

- AS9100 accreditation
 - ISO9001 accreditation
 - QS9000 accreditation
 - Society of British Aerospace Companies (SBAC) TS 157 approval
 - Civil Aviation Authority Australia
 - Ford Q1
- High quality standards demand that every batch of inserts is subjected to multiple visual, dimensional, and functional checks at predetermined intervals throughout the production process, using the latest high-precision test equipment.

Alcoa Fastening Systems will provide technical assistance to production engineers so that optimum installation efficiency can be achieved and maintained. Recoil brand coils are manufactured to the following capability standards:

- NASM122076 Series - Free Running - UNC
- NASM124651 Series - Free Running - UNF
- NASM21209 Series - Locking
- NASM8846

BS7751 - Metric - Coarse
BS7752 - Metric - Fine
BS7753
BS 4377
MA3279, MA3280, MA3281 - Metric - Free Running
MA3329, MA3330, MA3331 - Metric - Self Locking
AS6733 Series - UNF - Unplated
AS8455 Series - UNF - Cadmium Plated
AGS3600 Series - UNF - Cad. Plated - Self Locking
AGS3700 Series - Nimonic Alloy 90 - Self Locking
General Electric - C981, N926 Series
LN 9499, LN 9039
DIN 8140

Product Range

Thread Inserts

The Recoil system consists of precision inserts, quality high speed taps, and easy-to-use installation tools which are used for repairing damaged screw threads or creating strong new threads. Recoil helically wound screw-thread inserts are generally manufactured from Type 304 (18-8) stainless steel wire cold rolled into a diamond shaped cross section. Recoil inserts can be supplied in other materials such as Inconel, Nimonic 90, Nitronic 60, Phosphor Bronze and Type 316 stainless steel.

Recoil inserts are available in either standard free running form or screw lock type which provides an internal locking feature. Inserts are manufactured for every thread form including UNC, UNF, BSC, BSW, BSP, BA, NPT and ISO Metric thread sizes.

Thread Repair Kits

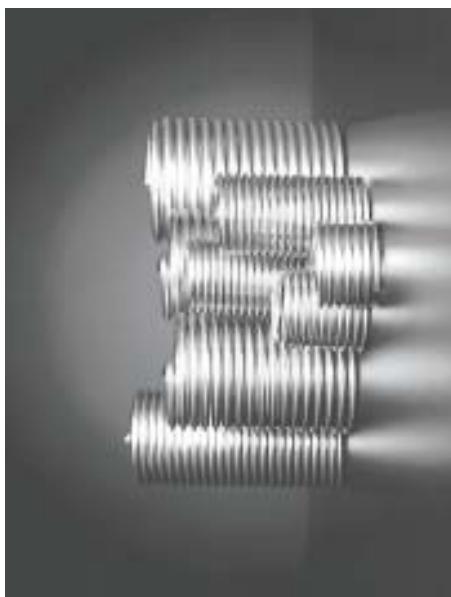

A full range of Recoil thread repair kits, covering the majority of sizes commonly in use today, is available from AFS. Recoil kits contain an HSS tap, installation tools, precision stainless steel inserts, and instructions, in a sturdy reusable container. Recoil problem-solving repair kits are available in single or multiple size format.

Installation Tooling

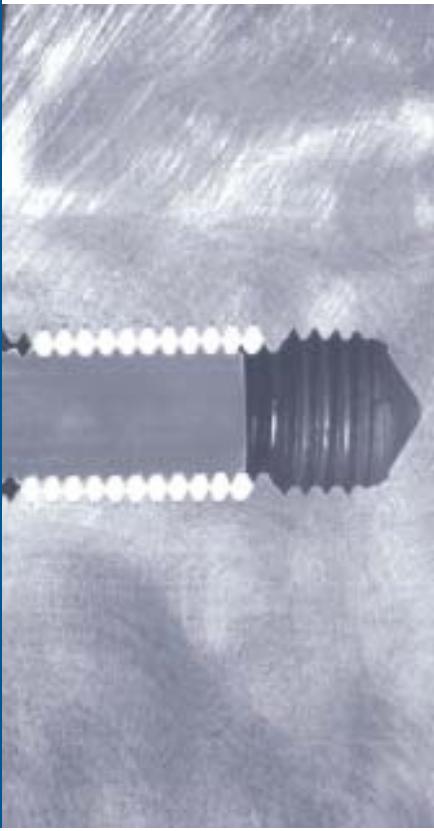

Alcoa Fastening Systems also offers a selection of work arms and power tooling, including high efficiency pneumatic and electric installation tools for in-line production or repetitive maintenance situations. A range of associated tooling is available to facilitate insert installation, including manual installation tooling and manual, spring, and pneumatic operated tang breakoff tools.

Taps and Gauges

Optimum results can be achieved with Recoil taps and gauges to suit hand-tapping through to volume production requirements. Using the "Go - No Go" gauge, tapped holes can be gauged to enable a precision fit.

Recoil Inserts

How a Recoil Insert Works

Recoil inserts are rolled from high quality stainless steel wire with a diamond shaped cross section, wound to the shape of a spring thread. Once the wire is wound into a helical coil and installed into a tapped hole, it provides a permanent and wear resistant thread in the parent material that is generally stronger than the original thread. The inserts are designed to be greater in diameter than the tapped hole and compress as they are installed. This allows maximum surface contact area with the tapped thread, safely and permanently anchoring the inserts into place.

The insert's compensatory action shares the load over the entire bolt and hole, increasing holding or pull out strength. With a Recoil insert in place, load and stress are more evenly distributed.

Where to Use Recoil Inserts

When you encounter a damaged thread Recoil offers:

Repair

- Quickest and simplest method of repair to stripped or damaged threads
- A superior thread with great holding power
- Most cost-effective method of repair
- Returns thread to the original size
- Generally stronger than the original female thread

Insert Material

Recoil inserts are generally manufactured from Type 304 stainless steel (18-8), however inserts are available in a range of materials for special applications.

- **Stainless Steel Grade 304 (AS7245) Austenitic Corrosion Resistant Steel**
For normal applications up to 425°C (800°F)
- **Stainless Steel Grade 316 (AISI 316) Austenitic Corrosion Resistant Steel**
For Marine applications up to 425°C (800°F)
- **Inconel X-750 (AS7246) Nickel Alloy**
For high temperature applications 425°C - 550°C (800°F - 1000°F) or where low permeability is required.
- **Phosphor Bronze** (DIN 17677 or BS2783 PB 102) (300°C)
For electrical bonding joints or low permeability
- **Nimonic 90** (HR 503) for high temperature applications. (650°C / 1200°F)
- **Nitronic 60** (UNS S21800) Austenitic anti-galling alloy
- **Special purpose**
Materials such as Inconel 625 and Spring Steel Grade are also available to special order

Type

There are two basic types of Recoil Inserts available:

- **Free running** inserts which provide a standard female thread
- **Locking inserts** which provide a locking function for the female thread when the fasteners installed

Damaged Thread

Original Equipment Manufacturer

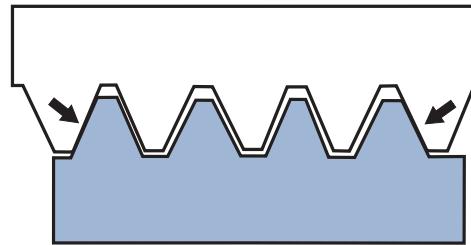

AFS offers innovative manufacturers the opportunity to design high quality product using lighter weight materials such as aluminum and magnesium alloys as well as carbon fiber materials while still achieving high strength and reliability in the threaded fastener assembly. Recoil brand inserts are widely used by manufacturers in:

- Automotive
- Electronic
- Aerospace
- Ship Building
- Defense
- Power Generation
- Transport
- Manufacturing Equipment

How Recoil Inserts Work

Pitch and Angle Error Compensation

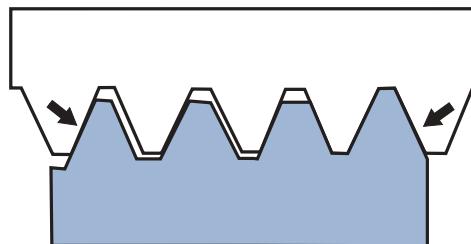

Problems

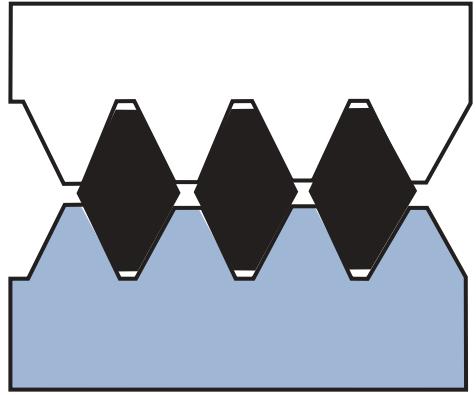

Angle error

Typical thread and angle errors may cause:

- Limited contact point
- Poor flank contact between bolt to parent thread
- Unequal distribution of bolt load over engaged threads
- Failure of threaded components when loaded

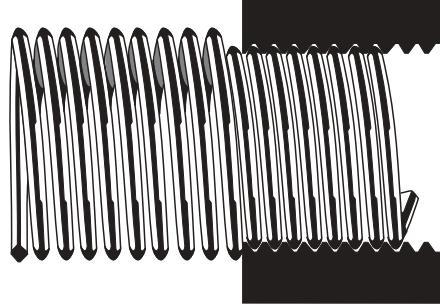

Solution

Recoil compensation effect

Recoil inserts reduce thread pitch and angle errors to provide:

- Greater fastener strength
- Greater contact area
- Equally distributed load over all tapped threads
- Reduced stress concentration thereby extending fatigue life

Recoil Insert in "Semi Installed" position.

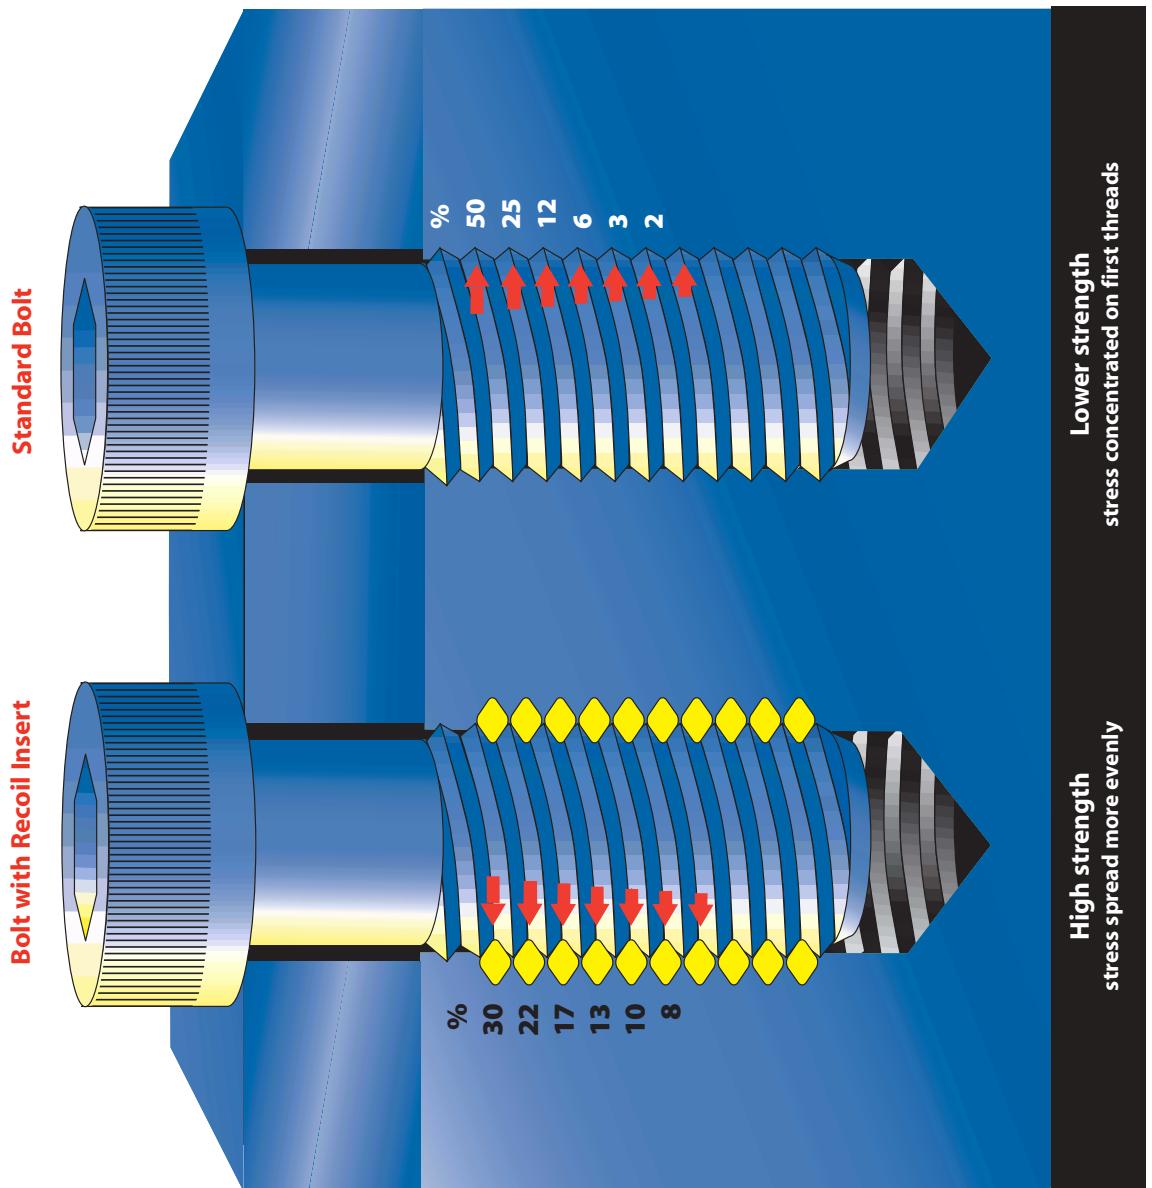

Insert installation and retention

Uninstalled, Recoil inserts are greater in diameter than the tapped hole in the parent material into which they are to be installed. During the assembly operation the diameter of the leading coil is reduced thereby permitting entry of the insert into the tapped hole. When the insert is installed at the correct depth, the coils expand and permanently retains the insert in place.

Unlike many 'solid' insert types, it is not necessary to use locking, swaging or keying operations to locate and retain Recoil inserts. Stress concentration problems which typically occur in the parent material when using solid inserts are therefore eliminated.

A Recoil insert will dimensionally adjust both radially and axially, to any expansion or contraction within the parent material.

How Recoil Inserts Work

The diagram above depicts graphically the advantages a Recoil insert has over a conventional thread. In conventional threaded joints over 75% of the load is placed on the first three threads of the assembly. The Recoil insert on the left shows how the spring-like design of the insert allows the shear loading to be transformed into a preferable "hoop stress" or radial loading over the entire length of the insert. This provides a much stronger thread than can be obtained by conventional drilling or tapping. This improved strength allows designers to select a fastener based on the minimum strength of the bolt, also allowing them to select smaller diameters and shorter thread lengths confidently even in low strength materials such as magnesium or aluminum alloys. (Refer to page 43 - Design Considerations)

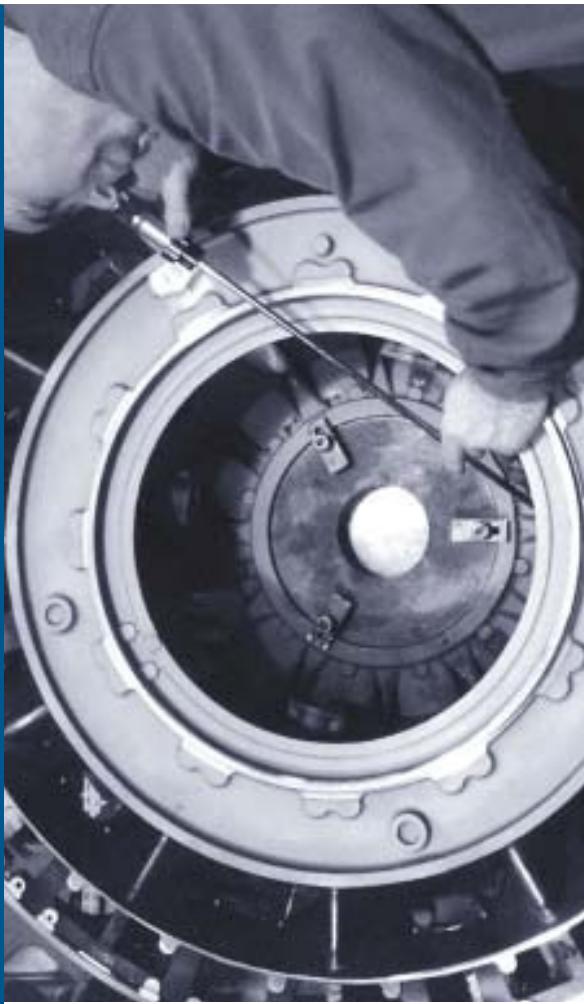

Locking Inserts

How Locking Inserts Work

The Recoil screw-locking insert is designed to provide a screw-locking feature which will retain screws or bolts under the most severe vibration or varying temperature conditions.

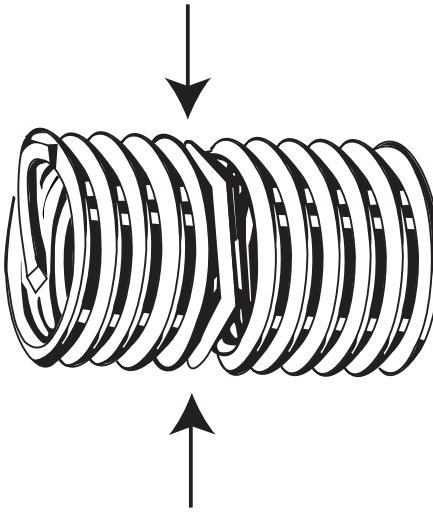

The insert locking configuration comprises a series of uniquely designed locking chords which, upon the engagement of a screw or bolt, deflect radially to permit the installation of the bolt. Upon bolt entry, these straight segments are flexed outwardly, creating pressure on the bolt. This pressure is applied between the flanks of the bolt thread so that contact area is maximized. Locking inserts retain locking torque over numerous assembly cycles. Refer to relevant specifications for insert life.

Each Recoil screw-locking insert type has a specifically designed locking configuration. This ensures that the insert meets its design specification requirements. Therefore the shape, depth, and number of locking chords will inevitably vary for differing thread types and sizes.

Locking Insert Design

Should a specific locking torque or function be required, AFS engineers can develop parts to suit customers' needs. As the bolt is wound through the locking chords of the insert it deflects the wire as shown by the internal arrows (A). This deflection causes the insert to push against the bolt resulting in a repeatable locking function from the insert.

Note: It is recommended that a cadmium plated or dry-film lubricated screw/bolt is used for screw-locking inserts applications. (See page 10 - Lubricants and Coatings)

Note: Installation of Recoil screw-locking inserts requires use of the Recoil Prewinder tooling. (Refer to page 33 - Tooling)

Locking Insert Torque Values

Locking torque values for unified inserts conform to NASM8846. These locking torque values are shown below.

Unified Coarse (UNC)

NOMINAL THREAD SIZE	Max Locking Torque	Min Locking Torque
2 (.086") - 56	20 oz.in	3 oz.in
3 (.099") - 48	32 oz.in	7 oz.in
4 (112") - 40	48 oz.in	10 oz.in
5 (.125") - 40	75 oz.in	13 oz.in
6 (.138") - 32	6 lb.in	1.0 lb.in
8 (.164") - 32	9 lb.in	1.5 lb.in
10 (.190") - 24	13 lb.in	2.0 lb.in
12 (.216) - 24	24 lb.in	3.0 lb.in
1/4 (.250") - 20	30 lb.in	4.5 lb.in
5/16 (.3125") - 18	60 lb.in	7.5 lb.in
3/8 (.3750") - 18	80 lb.in	12.0 lb.in
7/16 (.4375") - 14	100 lb.in	16.5 lb.in
1/2 (.5000") - 13	150 lb.in	24.0 lb.in
9/16 (.5625") - 12	200 lb.in	30.0 lb.in
5/8 (.6250") - 11	300 lb.in	40.0 lb.in
3/4 (.7500") - 10	400 lb.in	60.0 lb.in
7/8 (.8750") - 9	600 lb.in	82.0 lb.in
1 (1.000") - 8	800 lb.in	110.0 lb.in
1 1/8 (1.1250") - 7	900 lb.in	137.0 lb.in
1 1/4 (1.250") - 7	1000 lb.in	165.0 lb.in
1 3/8 (1.3750") - 6	1150 lb.in	185.0 lb.in
1 1/2 (1.5000) - 6	1350 lb.in	210.0 lb.in

Unified Fine (UNF)

NOMINAL THREAD SIZE	Max Locking Torque	Min Locking Torque
3 (.099) - 56	32 oz.in	3 oz.in
4 (.112) - 48	48 oz.in	10 oz.in
6 (.138) - 40	6 lb.in	1.0 lb.in
8 (.164) - 36	9 lb.in	1.5 lb.in
10 (.190) - 32	13lb.in	2.0 lb.in
1/4 (.2500) - 28	30 lb.in	3.5 lb.in
5/16 (.3125) - 24	60 lb.in	6.5 lb.in
3/8 (.3750) - 24	80 lb.in	9.5 lb.in
7/16 (.4375) - 20	100 lb.in	14.0 lb.in
1/2 (.5000) - 20	150 lb.in	18.0 lb.in
9/16 (.5625) - 18	200 lb.in	24.0 lb.in
5/8 (.6250) - 18	300 lb.in	32.0 lb.in
3/4 (.7500) - 16	400 lb.in	50.0 lb.in
7/8 (.8750) - 14	600 lb.in	70.0 lb.in
1 (1.0000) - 12	800 lb.in	90.0 lb.in
1 1/8 (1.1250) - 12	900 lb.in	117.0 lb.in
1 1/4 (1.2500) - 12	1000 lb.in	143.0 lb.in
1 3/8 (1.3750) - 12	1150 lb.in	165.0 lb.in
1 1/2 (1.5000) - 12	1350 lb.in	190.0 lb.in

Locking torque values for metric Recoil inserts conform to MA3329, MA3330 and MA3331. These locking torque limits are shown above.

Note: Unplated, heat-treated screws or stainless steel screws should not be used with screw-lock inserts. An anti-seize compound (Molybdenum Disulfide, etc) should be applied to the screw to minimize galling and achieve maximum cycle life. Also available are inserts plated with cadmium per QQ-P-416, Type II, or dry film lubricant per MIL-L-46010 (no graphite) which improves wear life of the screw and insert.

Note: It is imperative that the bolts fully engage all locking coils for correct torque and all insert coils for maximum strength.

Locking Insert Torque Values

Metric Coarse Series

NOMINAL THREAD SIZE	Max Locking Torque	Min Locking Torque
M2.2 x 0.45	0.14 Nm	0.02 Nm
M2.5 x 0.45	0.23 Nm	0.05 Nm
M3 x 0.5	0.45 Nm	0.1 Nm
M3.5 x 0.6	0.68 Nm	0.12 Nm
M4 x 0.7	0.9 Nm	0.15 Nm
M5 x 0.8	1.6 Nm	0.3 Nm
M6 x 1	3 Nm	0.4 Nm
M7 x 1	4.5 Nm	0.6 Nm
M8 x 1.25	6 Nm	0.8 Nm
M10 x 1.5	10.5 Nm	1.4 Nm
M12 x 1.75	15.5 Nm	2.1Nm
M14 x 2	23.5 Nm	3 Nm
M16 x 2	31.5 Nm	4.2 Nm
M18 x 2.5	42 Nm	5.5 Nm
M20 x 2.5	54 Nm	7 Nm
M22 x 2.5	67.5 Nm	9 Nm
M24 x 3	80 Nm	10.5 Nm
M27 x 3	94 Nm	12 Nm
M30 x 3.5	108 Nm	14 Nm
M33 x 3.5	122 Nm	15.5 Nm
M36 x 4	136 Nm	17.5 Nm
M39 x 4	150 Nm	19.5 Nm

Metric Fine Series

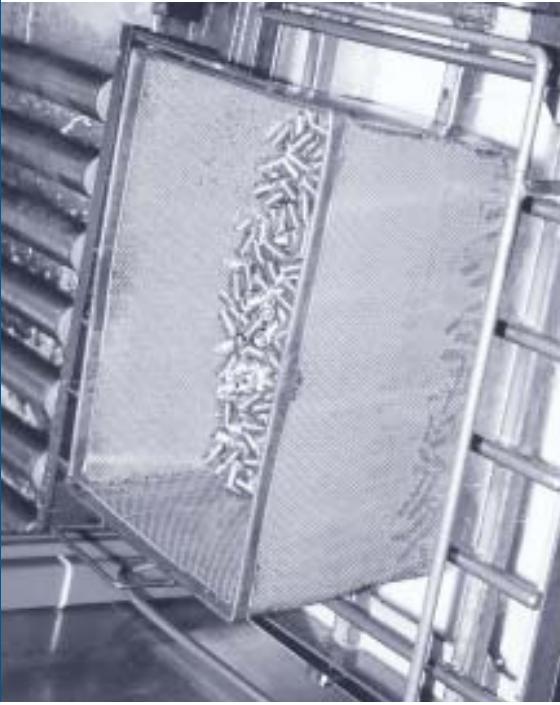

NOMINAL THREAD SIZE	Max Locking Torque	Min Locking Torque
M8 x 1	6 Nm	0.8 Nm
M10 x 1	10.5 Nm	1.4 Nm
M10 x 1.25	10.5 Nm	1.4 Nm
M12 x 1.25	15.5 Nm	2.1 Nm
M12 x 1.5	15.5 Nm	2.1 Nm
M14 x 1.5	23.5 Nm	3 Nm
M16 x 1.5	31.5 Nm	4.2 Nm
M18 x 1.5	42 Nm	5.5 Nm
M20 x 1.5	54 Nm	7 Nm
M22 x 1.5	67.5 Nm	9 Nm
M18 x 2	42 Nm	5.5 Nm
M20 x 2	54 Nm	7 Nm
M22 x 2	67.5 Nm	9 Nm
M24 x 2	80 Nm	10.5 Nm
M27 x 2	94 Nm	12 Nm
M30 x 2	108 Nm	14 Nm
M33 x 2	122 Nm	15.5 Nm
M36 x 2	136 Nm	17.5 Nm
M39 x 2	150 Nm	19.5 Nm
M36 x 3	136 Nm	17.5 Nm
M39 x 3	150 Nm	19.5 Nm

Locking torque values for metric Recoil inserts conform to MA3329, MA3330 and MA3331. These locking torque limits are shown above.

Note: Unplated, heat-treated screws or stainless steel screws should not be used with screw-lock inserts. An anti-seize compound (Molybdenum Disulfide, etc) should be applied to the screw to minimize galling and achieve maximum cycle life. Also available are inserts plated with cadmium per QQ-P-416, Type II, or dry film lubricant per MIL-L-46010 (no graphite) which improves wear life of the screw and insert.

Note: It is imperative that the bolts fully engage all locking coils for correct torque and all insert coils for maximum strength.

Finishes & Coatings

Typical Recoil wire thread insert finishes and coatings

PLATING / FINISH	PART NUMBER SUFFIX	APPLICABLE PROCESS SPECIFICATION	
Silver Plating	AG	DTD 939	
Cadmium Plating	C	QQP-416 or DEF STD 03-19	
Dry Film Lubricant	D	MIL-L-8937 or MIL-L-46010	
Red Dye	Not Applicable	Applied to all Recoil locking inserts for identification where called for by specification*	
* Recoil inserts may also be dyed in other colors such as Green and Blue for identification purposes.			
MATERIAL TYPE	MAX. TEMPERATURE	TYPICAL APPLICATIONS (SEE SECTION ON LUBRICANTS)	COATINGS (SEE SECTION ON LUBRICANTS)
Stainless 304	425°C (800°F) 315°C (600°F) CONTINUOUS	Most general applications in all materials	Non-finished Dry film lubricant Silver Cadmium
Stainless 316	425°C (800°F) 315°C (600°F) Improved corrosion resistance Salt water applications		Non-finished Dry film Lubricant Silver Cadmium
Nitronic 60	425°C (800°F) 315°C (600°F) Anti-galling		Dry film lubricant
Phosphor Bronze	300°C (572°F) 235°C (455°F) Copper parts		Cadmium
Inconel x 750	650°C (1200°F) 550°C (1020°F) Non magnetic / Low permeability applications	Aerospace / Turbines / Corrosive atmospheres	Silver
Nimonic alloy 90	650°C (1200°F) 550°C (1020°F) Aerospace / High temperature use	Aerospace / Turbine applications	Copper Silver

Lubricants and Coatings

It is important that correct selection of the most suitable fastening lubricant or coating is made at the design stage for long term security within the bolted joint.

The ideal finish or coating for the insert is dependent upon the optimum coefficient of friction (governed by the bolt material and surface finish) and the required service conditions of the assembled parts, e.g. temperature, chemical influences, humidity, and dust.

The coefficient of friction (μ) of most threaded components will generally vary between $\mu = 0.15$ and $\mu = 0.35$.

For example differences occur between bolts made of Grade 8.8 steel I (Werkstoff 1.0503), compared with the same size of bolt produced from an austenitic stainless steel X5 CrNi 18-9, (Werkstoff 1.4301).

Differences also occur between bolts having different surface coatings, such as electro-galvanizing, hot galvanizing, cadmium plating, or chromium plating.

Finishes & Coatings

Silver Plating

Primarily used to reduce the effects of galling (seizure) of screw threads in high temperature service applications.

Silver plating is the most commonly used coating for aero-engine fasteners providing an even degree of lubrication up to a maximum service temperature of about 650°C (1200°F).

The plated silver is electrolytically deposited in typical thicknesses up to 6.3µm (0.00025").

Silver plated wire thread inserts may be installed into various housing materials including magnesium alloys, aluminum alloys, corrosion and heat resistant materials, etc.

Caution must be emphasized where inserts are to be installed into titanium alloy components which may exceed a service temperature of 300°C (570°F). Silver plated inserts are not recommended with titanium housings as stress corrosion, resulting from the combination of silver with titanium may occur in the housing material.

Cadmium Plating

In mildly corrosive or marine environments, cadmium plating is the preferred treatment for providing protection against pitting of the insert/bolt materials and to minimize the risk of thread seizure.

Plating thickness may vary depending on particular applications, between 2µm - 5µm (0.0001" - 0.0002"). Following cadmium plating, either a bronze or olive drab chromate finish will be used to provide uniformity in the overall finish.

It should be noted that cadmium plated parts must not:

- Be subjected to temperatures exceeding 235°C (455°F)
- Come into contact with fuel or hot oil
- Come into contact with food or drinking water
- Be used with titanium components either directly or indirectly as, at elevated temperatures, embrittlement and subsequent component failure may occur

Warning: Cadmium is a highly toxic compound. Because of its poisonous nature extreme care must be taken when handling.

Dry Film Lubricants

Used for mildly corrosive or high temperature applications, dry film lubricants comprise suspensions of small particles of solid lubricants such as molybdenum disulphide (MoS₂) or PTFE, in organic or inorganic binders. They are applied as a thin film (5µm - 20µm) to grease-free metal surfaces.

Through careful selection of appropriate additives and solvents, specific lubricants may be formulated to suit most industrial applications to service temperatures around 315°C (600°F).

Special high temperature lubricant coatings are available for use up to 425°C (800°F).

Recoil inserts may be coated with dry film lubricant in either the non-finished (passivated) condition or after cadmium plating treatment for maximum corrosion protection.

Red Dye Coating

Recoil screw-locking inserts are, generally color coded with a red dye coating for identification purposes only. This organic resin based dye does not affect the installation or function of the inserts and normally does not need to be removed.

However, if in extreme conditions of cleanliness (such as precision instrument assembly in clean room conditions) removal of the dye may be desired. The red dye may be removed by soaking the inserts in a denatured alcohol solution prior to use.

To prevent galling or seizing when using an unplated or corrosion resistant screw/bolt in a screw-locking insert, we recommend the use of an anti-seize compound on the bolt threads.

Finishes & Coatings

Corrosion Protection

Under some service conditions, Recoil inserts and their mating parts may be subjected to a degree of corrosion, the severity of which is dependent upon the particular application.

Factors such as differing material types, atmospheric conditions, chemical attack, and even frequency of use will have an appreciable effect on the longevity of the bolted joint.

The following are recommendations to minimize corrosion within the bolted Recoil insert assemblies.

Normal Service: Natural atmospheric environment with the screw/bolt permanently installed into the insert not adjacent to salt water.

Severe Service: Mildly contaminated atmospheric environments involving moisture, occasional exposure to a chloride air or sea spray, and where the screw/bolt may be removed from the insert for extended periods of time.

Extreme Severe Service: Assembly is exposed to salt water, corrosive atmosphere, high temperature, or the screw/bolt is frequently removed from the assembly, allowing the ingress of water into a blind hole.

In addition to methods 1, 2 and 3 below, further corrosion protection can be achieved by:

- Using blind holes wherever possible
- Using a sealing, insulating, or step-down type washer under the head of the bolt
- Using bolts that extend completely through the entire length of the insert
- In critical applications, the use of a non-hardening seal or compound over the joint and protecting bolt thread is recommended

Note - For extremely severe service conditions involving temperatures in excess of 425°C (800°F) or contact with acids, alkalies or sea water, stainless steel inserts are not recommended.

PARENT MATERIAL	SERVICE CONDITIONS		
	NORMAL	SEVERE	EXTREME SEVERE
Aluminum	None	Methods 2 or 3	Methods 1, 2 & 3
Magnesium	Methods 2 or 3	Methods 2 and 3	Methods 1, 2 & 3

METHOD 1	METHOD 2	METHOD 3
Parent Material Protection Aluminum. For oxide coating use Alodine, Anodize, Iridite, or similar. Iridite 14 or 14-2 (MIL-C-554) is recommended for critical parts rather than anodizing (MIL-S-5002)	Coat the insert with one of the following: Cadmium per QQ-P-416, Type II 0.0001" thick; or Dry Film Lubricant per MIL-L-893 (must be free of graphite)	Separate the parent material from the insert by using liquid zinc chromate primer, Federal Specification TT-P-1757. Apply the primer to the hole sparingly and install while the primer is still wet.

Typical Corrosion Recommendations

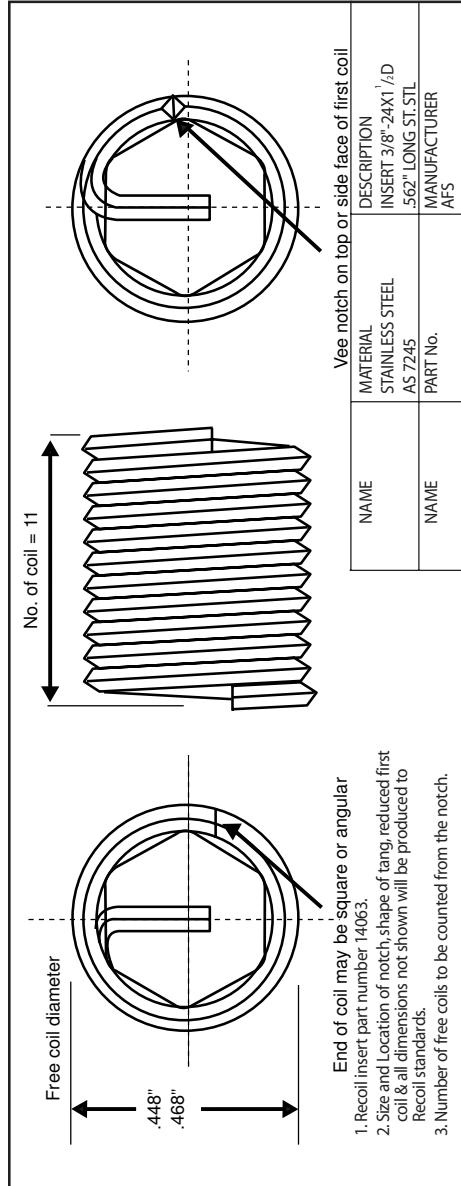

Gas and Water Applications

Where gas or water threads are being manufactured or repaired it is important that an AFS sales office be consulted regarding the type of seal that will be provided in this situation. A wire insert may not provide a satisfactory thread seal.

MS Insert Dimensional Data

Drawing Call-Out

An example of a typical drawing specification for a Recoil insert is shown below:

A typical drawing call-out for a Recoil screw-locking insert 3/8" - 24 x 11/2 dia. long Class 3B Unified Fine Thread (UNF) is shown.

Drawing call-outs can be simply defined by using a production sequence process sheet to provide the operational steps with the drawing showing dimensional limits and data. (Example shown below)

- 1) Drill hole 25/64" (.3906") diameter, depth .812" plus your normal standard for drilling depth.
- 2) Countersink 120° +/- 5° .42"/.45" diameter.
- 3) Tap with Recoil STI Tap No. 44065 (class 3B) full thread depth .600".
- 4) Gauge with Recoil Gauge No. 64063 or according to your inspection requirements.
- 5) Install Recoil screw-lock insert 14063 with Recoil Inserting Tool No. 54061.
- 6) Break off driving tang with Recoil Tang Break-off Tool No. 59280.

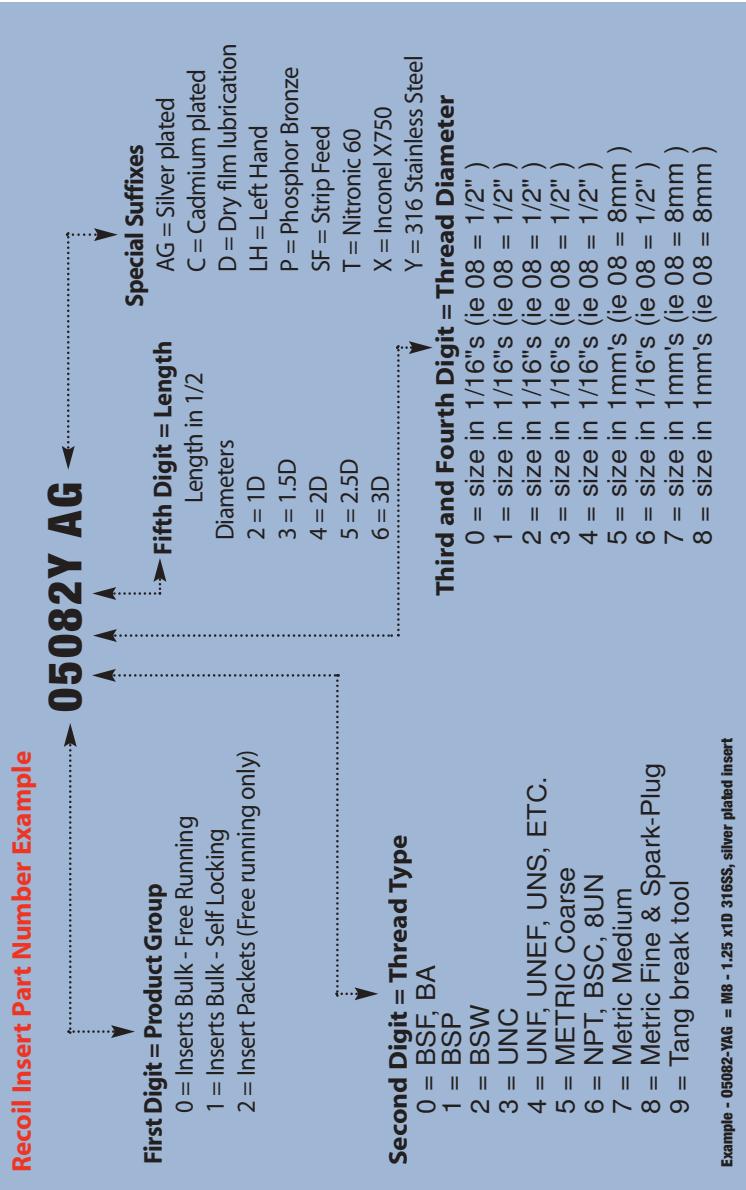

MS Insert Dimensional Data

Recoil Thread Insert Part Numbering System

Recoil insert product part numbering system uses a logically structured 5 digit basic part number. Suffixes are typically added to differentiate between standard or non-standard features.

This guide defines the structure of Recoil part numbers and may be used for reference to identify a Recoil insert from its part number.

Recoil Insert Part Number Example

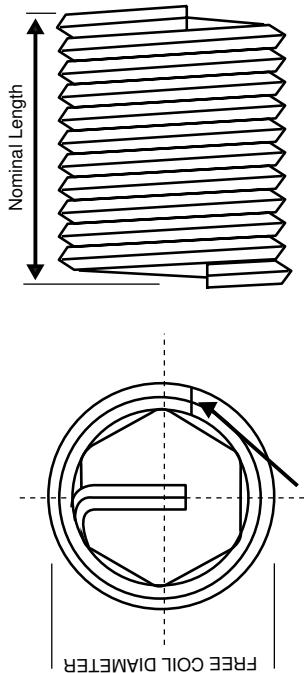

Inch Series Insert Dimensional Data

Recoil Inch Insert Part Number Call-Out and Dimensional Data

THREAD SIZE	PART # - STANDARD INSERT			PART # - LOCKING INSERT			FREE COIL DIAMETER MIN MAX	NUMBER OF COILS NOMINAL LENGTH

STI Taps

Recoil Insert Taps

Recoil taps differ from standard taps dimensionally and only Recoil Screw Thread Insert (STI) Taps are suitable for use with Recoil Wire Thread Inserts.

Recoil taps are manufactured to precise standards from either High Speed Steel (HSS) or (HSS-E) with ground threads and are available with taper, intermediate, and bottoming leads. They have a larger diameter but the same pitch as a standard tap in order to accommodate the wire insert.

Spiral point and spiral flute machine taps are also available for volume production purposes. For all sparkplug applications, pilot nose taps are recommended and are available for common metric thread sizes.

The Recoil thread insert when installed into a correctly tapped hole will provide the applicable internal thread tolerance for the installed bolt.

Note: Tapped hole size can be significantly affected by variations in drill size, parent material, or lubricant so in close tolerance applications some testing for an optimum combination is recommended.

Thread Class

Unified Thread Class

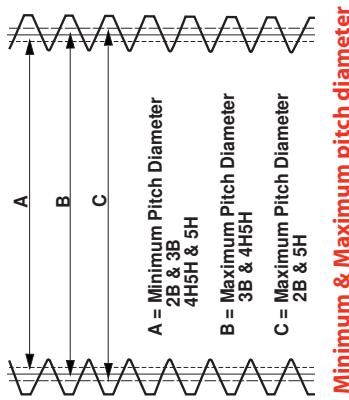

In the unified thread system, the minimum pitch diameter for a 2B hole (medium fit) or 3B hole (close fit) are the same, while the maximum pitch diameter is greater on the 2B hole (medium fit). Recoil taps for unified threads are made to a 3B hole (close fit) tolerance.

Metric Thread Class

In the metric thread system the minimum pitch diameter for a 5H hole (medium fit) or 4H5H hole (close fit) are the same, while the maximum pitch diameter is greater on the 5H hole (medium fit). Recoil taps for metric threads are made to 4H5H hole (close fit) tolerance.

Metric thread tolerance equivalents standards

Standards	Recoil Standards
Medium	Metric 6H
Close	Metric 5H

Minimum & Maximum pitch diameter

Tap Type and Applications

The most commonly used type of Recoil taps are defined together with their typical applications. The Taper, Intermediate, and Bottoming are short machine taps (suitable for hand tapping), while the Spiral Point and Spiral Flute are used in production applications.

Taper

Taper (or Roughing Taps) are used for starting precision and difficult holes. This tap has a lead of eight threads, but no size reduction.

Intermediate

Intermediate (or Plug/Second), used in most general purpose applications to facilitate thread cutting true to the drilled hole. The tap has a lead of four threads, but no size reduction.

Bottoming

Bottoming Taps are used to ensure the minimum thread run-out when tapping to the bottom of blind holes. The tap has a lead of two threads and would normally be preceded by a taper or an intermediate tap.

STI Taps

Pilot Nose

Pilot nose taps have been developed for repairing damaged threads without the need for drilling prior to tapping. This style of tap allows the use of the existing thread as a guide in tapping a straight hole. This style of tap is widely used in repairing damaged spark plug threads.

Spiral Flute

Spiral Flute taps are recommended for machine tapping for all blind hole applications, particularly in soft materials such as copper, magnesium and aluminum which produce long stringy swarf.

Spiral Point

Spiral Point Taps are recommended for machine tapping through holes. These taps provide for chip clearance within the lead of the tap.

Surface Coatings

Recoil taps can be supplied in different surface coatings for special order requirements. Benefits of surface coatings include:

- Longer tool life
- Increased productivity
- Tools can be run at higher feeds and speeds
- Lower maintenance costs

Titanium Carbonitride - TiCNite (TiCN)

TiCNite coated taps have a very high surface hardness and are generally tougher than other coating materials. It has a high resistance to edge chipping.

Recoil Tap Part Numbering System

The system of identification used for Recoil taps is categorized into two primary sections: inch threads and metric threads. The tap annotation for both thread designations is very similar and therefore easy to follow.

Tap Part Number	4	3	04	5
Inch Series	Product	Thread Type	Thread Size Diameter in 1/16"	Tap Style
	4 = Tap	3 = UNC 4 = UNF	04 = 1/4" 4 = taper 5 = intermediate	6 = bottoming 7 = pilot nose 8 = spiral point 9 = spiral flute
Metric Series			04 = 4mm	4 = taper 5 = intermediate 6 = bottoming 7 = pilot nose 8 = spiral point 9 = spiral flute

Titanium Nitride - TiNite (TiN)

TiNite coating is a good choice for protecting the tap. It can achieve a longer life than uncoated taps and can be used at higher speeds.

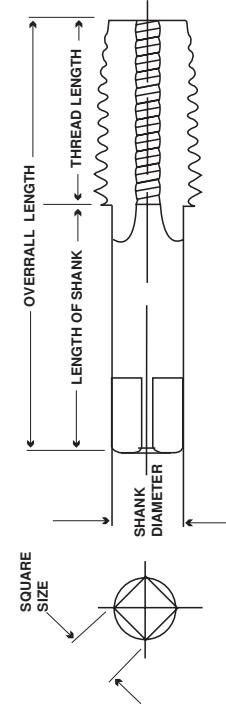

Chromium Nitride (CrN)

This PVD coating was developed for use in non-ferrous areas where titanium based coatings were not successful. It is recommended for the machining and forming of titanium and copper and is harder than conventional chrome plating. The PVD coating process has no environmental side effects.

Standard size drills are suggested even though in these sizes they vary slightly from minor diameter limits. Drill sizes are recommended only and test should be carried out to select the one suitable for the material involved.

Countersinking: It is recommended that a 120° countersink is provided before tapping to prevent a feather edge at the start of the lead thread. When design prevents the use of a countersink, any feather edges or deformed material at the thread lead should be removed before tapping. This will facilitate insert installation and reduce the effects of removing the countersinking operation.

Drilling Depth: The minimum drilling depth "S" allows for one pitch chip clearance between the tip of the tap and the bottom of the drilled hole. "S" minimum allows for tap clearance, the maximum amount of insert set-down and the countersink. Where a spiral pointed tap is used, the drill depths shown should be increased to allow for chip clearance.

Fitted Insert: R = Maximum length of engaged portion of screw when tang is removed. Q = Minimum full tapped thread length. T = Minimum tapping depth - including 3 1/2 threads of plug tap. S = Minimum drill depth - excluding point.

Standard size drills are suggested even though in these sizes they vary slightly from minor diameter limits. Drill sizes are recommended only and test should be carried out to select the one suitable for the material involved.

Countersinking: It is recommended that a 120° countersink is provided before tapping to prevent a feather edge at the start of the lead thread. When design prevents the use of a countersink, any feather edges or deformed material at the thread lead should be removed prior to tapping. This will facilitate insert installation and reduce the effects of removing the countersinking operation.

Drill Depth: The minimum length of engaged portion of screw when tang is removed. **Q** = Minimum full tapped thread length.
Fitted Insert: R = Maximum length of one pitch of the tap and the bottom of the drilled hole.
 "S" minimum allows for one pitch chip clearance between the tip of the tap and the bottom of the countersink. Where a spiral pointed tap is used, the drill depths shown should be increased to allow for chip clearance.

Gauges

Recoil Thread Gauges

Thread gauging is recommended wherever precision threads are required. The quality of the tapped hole which accommodates the insert determines the finished size and hole quality after the insert has been installed. If the finished tapped hole gauges satisfactorily, the installed insert will be within the thread tolerance.

Technical Information

Recoil gauges 1/2" M12 and below have at least a .0002" or 5 um wear allowance on the Go nib. Gauge handle and all gauge nibs are marked with the extreme product limits for particular size and class of fit. Where precision is required, 3B gauges should be used. When using locking inserts, 3B gauges should be used as close precision is required.

Gauges

Fits and Tolerances

Recoil gauges are supplied for two different classes of fit (tolerances). These are close and medium tolerance.

Gauges are used to check the pitch diameter of the tapped hole; the "NoGo" end of the gauge checks the pitch diameter is not too large and the "Go" end checks the pitch diameter is not too small.

Hand Installation Tools

Recoil Tools

AFS supplies a range of associated Recoil tooling to facilitate Recoil insert installation. The advantage of the Recoil tooling system is its simplicity, versatility, and ease of use. The hand installation tooling range includes the manual installation tool, the semi production "Prewinder" type, as well as manual and spring operated tang break off tools.

Manual Tool

The standard Recoil insert installation tool is the most practical and simple to use for general applications. This tool may be used to install 1D through to 3D length inserts, but care must be taken to ensure that the adjustable collar is correctly set to suit the particular type and length of the Recoil insert. If the collar is incorrectly set, the insert will not drive properly and the tool may slip off the tang as the insert enters the hole.

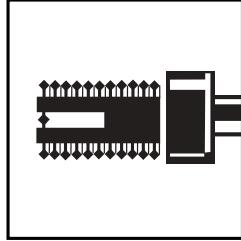

For general use, the collar should be adjusted such that the insert tang is positioned mid-way along the slot with the insert coils compressed. This will allow the insert free movement to suit the parent material thread pitch during installation.

If the installation tool is used to break off the tang, then it must be lifted clear of the insert following installation and replaced into the insert at 90 degrees to its drive position. This ensures that the tool is correctly placed on the insert tang. Tap the tool sharply downward to produce a clean tang break.

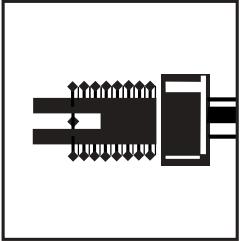

Note: The manual installation tool is not recommended for the installation of locking inserts.

Note: Recoil manual tools are not recommended for use with other brands of wire thread inserts.

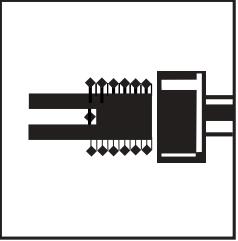

Collar Adjusted Too Low

Collar Adjusted Correctly

Collar Adjusted Too High

Tang Removal

Hand Installation Tools

Semi Production "Prewinder" Type

Installation Tool

This type of tool is ideal for installing inserts in small production runs or in areas where compressed air or electricity are not available and offers a quicker alternative to the simple hand installation tool. The tool is suitable for use when installing free running and locking inserts.

Threaded Mandrel Type

The threaded mandrel type is suitable for the installation of free running and locking inserts. The mandrel is wound into the insert which is then wound into the tapped hole. The mandrel is removed by turning the crank in a counter clockwise direction, leaving the insert in place.

Note: The threaded mandrel type installation tool is recommended for installing locking inserts.

Recoil Tang Break Tools

Recoil Tang Break Off Tools

Tang break off tools are available in hand, semi automatic spring type and pneumatic. The spring loaded and pneumatic tang break tools are recommended for removal of tangs in production applications. For large diameter fine thread inserts, e.g. M18-1.5 and above, 3/4-16 and above, the use of long nose pliers is an alternative method to break the tang.

Manual Tang Break Tool

The simple Recoil manual tang removal tool is suitable for low volume tang removal and is used for insert sizes up to 1/2" or M12. On larger sizes the multipurpose Recoil installation and tang break tool should be used. For tang removal, the tool is simply lifted and turned 90°, which will put the slot at right angles to the tang, then pushed downward with a sharp blow.

Spring Loaded Tang Break Tool (Picture)

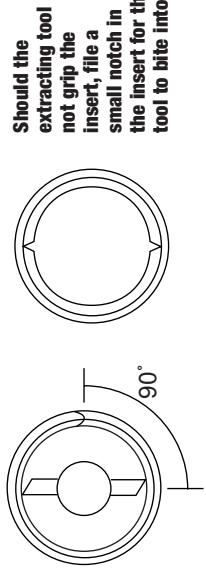

Spring loaded tang break tools offer effective removal of insert tangs and are suited from medium to large insert usage. Being spring loaded this tool requires no external power source and is suitable for tang removal on insert sizes up to 1/2" or M12. This tool is a spring loaded punch and when the tool is pushed down, the pin punches downward breaking off the tang.

Pneumatic Tang Break Tool

The pneumatic tang break tool is designed for high volume applications where rapid, effortless tang removal is required on insert sizes up to 3/4" or M20. This tool works on the same basis as the spring loaded tool, except the pin punches downward when an air cylinder is actuated by the valve.

Extraction Tool

Should inserts need to be removed, the use of the Recoil extraction tool is recommended. Extraction tools are simple and easy to use. As correct positioning will make the extraction easier, the tool should be turned 90° from the start of the coil allowing easy winding out of the insert. If the extraction tool is not gripping the insert, the edges can be resharpened.

Size of extraction tool and related size inserts

Power Tools

The Recoil range of power tooling ensures consistent high volume thread insert installation for a variety of applications.

Recoil powered installation tools may be supplied for use with either a compressed air supply or via a stabilized low voltage power supply to suit your particular requirements. Both equipment types offer significant productivity gains for high volume insert use.

Pneumatic Power Tooling

- Wide thread size range #2-56 through 3/4", or M2.5 through M16, coarse and fine
- Rugged and versatile air motor
- May be used with captive strip feed or bulk insert insertion
- Standard speed 1500 rpm
- Auto reverse on release of trigger

The complete pneumatic insert installation tool comprises three components:

- Air motor with single lever control to install and retract
- Adaptor - connect the motor to the insert drive nozzle - small and large types
- Front end assembly nozzle to suit the particular insert thread size

Electric Power Tooling

- Size range #2-56 through 1/4", M2.5 through M8
- Auto reverse on installation
- Clean, lightweight, quiet
- Suitable for bulk insert only
- Recoil offers two different types of air motors, the 56010 series and the NR-HL series. For further details please contact your Recoil distributor.

Compressed Air Supply for Pneumatic Installation Tools

PRESSURE RECOMMENDATIONS									
FOR INSERT SIZE									
Inch	#2	#4	#5	#6	#8 #10	1/4"	5/16"	3/8"	7/16"
Metric	M2 - 2.5	M2.5	M3	M3.5	M4, M5	M6, M7	M8	M10	M12
RECOMMENDED PRESSURE	psi	25	20-30	25-30	40	45	50-60	60	70-80
bar	1.70	1.3-2.0	1.7-2.0	2.72	3.06	3.4-4.0	4.0	4.76	4.7-5.4
MPa	0.172	0.138-0.206	0.172-0.206	0.275	0.310	.344-.413	0.413	0.482	0.482-0.551

If difficulty is encountered within the above settings, reduce the pressure until the optimum setting is found. It is imperative that a regulated moisture-free and filtered air supply is used with all Recoil pneumatic tooling. Reliability will be affected if an adequate and regulated air supply is not used with these tools. Guidelines for typical Recoil insert tool pressure requirements are shown above.

Power Tools

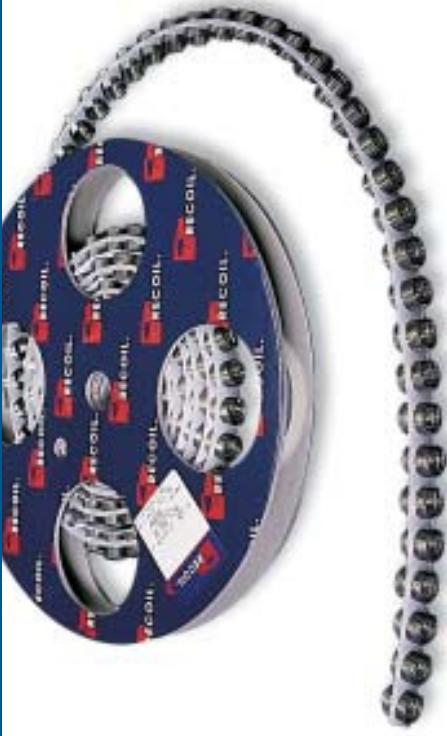

Recoil Inserts-Pneumatic Installation Tooling

Strip-Feed Inserts for Power Tools

To complete the Recoil power installation tools, Recoil has inserts available on strip (M2.5-M12, #2-5/16) to optimize production with increased installation cycles and reduced operator fatigue.

Recoil strip feed inserts provide many advantages such as:

- Minimized handling costs
- Faster, more economical assembly
- Positive inventory control

When used in combination with Recoil pneumatic installation tooling, each insert is retained in a plastic strip

which is passed through a slot in the front end assembly nozzle, indexing the insert to the installation mandrel.

Recoil Strip-Feed inserts are available in most common thread diameters and lengths in addition to the various surface finishes which are available on standard Recoil bulk inserts.

The table shows some commonly supplied Recoil Strip-Feed inserts and defines the typical quantity of inserts supplied per reel for each given thread size.

Additional insert diameters and lengths may be available to special order.

Reference Table for Recoil Strip-Feed Inserts

INSERT PART NUMBERS	INSERT SIZE	INSERT LENGTH	NUMBER PER REEL	REEL TYPE
3542SF, 3543SF, 3544SF	4-40	1-2D	1000	Small

5043SF, 5044SF	M4	1.5-2D	1000	Large
5042SF	M4	1D	1000	Small
5052SF	M5	1D	1000	Large
5053SF, 5054SF	M5	1.5-2D	500	Large
5062SF, 5063SF, 5064SF	M6	1-2D	500	Large
5082SF, 5083SF, 5084SF	M8-1.25	1.5-2D	500	Large
5122SF, 5123SF, 5124SF	M12-1.75	1-2D	125	Large

Note: Strip feed inserts are also available with different finishes and coatings. Super reels are also available increasing the number of inserts available per reel.

Note: Prefixes of 0 are required for free running inserts and a prefix of 1 for locking inserts.

Pro Series™ Kit Contents

Available in a wide range of sizes, the Recoil Pro Series™ thread repair kit contains everything needed for complete thread repair projects: drill bit, tap, installation tool, and three lengths of inserts. The installation tool is easy to use, and the kit's contents come neatly arranged and retained in a sleek, durable case.

Thread Repair Kits

Recoil's innovative and cost-effective thread repair kits are utilized worldwide in industrial and automotive maintenance situations. Each kit contains:

- Quality high speed steel (HSS) ground thread intermediate (plug or 2nd) tap
- Quantity of inserts
- Installation / tang break tool
- Easy to follow instructions
- Sturdy reusable container
- Recommended drill size on the label

Spark plug kits have pilot nose taps for accurate self alignment eliminating the need for drilling.

The table below denotes the Recoil Insert Kit part numbers for each available thread size together with details of insert quantities included with each thread repair kit. Range kits include a number of popular sizes in metric, inch or a combination suited to particular industries.

Design Considerations

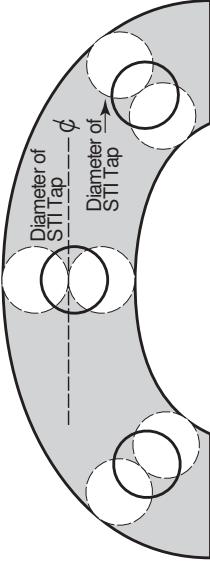

The following design considerations should be evaluated to maximize the security and safety of the fastening assembly using Recoil wire inserts.

Boss Dimensions

Boss thickness is a function of size and strength requirements and also design of components. For optimum strength, the minimum wall thickness should be twice the maximum diameter of the STI Recoil Tap. For minimum requirements, a wall thickness of twice the bolt diameter to center line may be adequate.

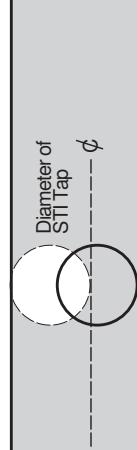

Boss Thickness

Edge Dimensions

The minimum edge distance recommended is the maximum diameter of the STI tap measured from the edge of the material to the center-line of the hole.

Edge Thickness

Minimum Material Thickness

The recommended minimum material thickness for through-hole applications is equal to the nominal length of the insert plus one pitch. This allows for proper countersinking and installation of the insert at 3/4 to 1-1/2 pitches below the surface of the component. In design critical applications, the minimum thickness may be reduced by eliminating the countersink and installing the insert to 1/4 to 1/2 pitch below the surface.

Class of Thread Fit

All Recoil inserts are produced to exacting tolerances where installation into the tapped hole will conform exactly to the parent material thread characteristics. It is therefore important that the tapped hole tolerances of either 2B or 3B (unified threads), or the applicable 4H5H and 5H (metric threads) combinations must be carefully controlled by precise tapping and gauging operations.

Gauging

Recoil inserts, when installed correctly in tapped and gauged holes, will conform with the tapped hole dimensions once the insert has been seated. Gauging of the tapped hole with the appropriate gauges prior to installing Recoil inserts is therefore highly recommended.

Bolt Engagement

Maximum strength of the bolted insert assembly will be achieved if the bolt or screw engages the full length of the insert. Ideally, the minimum bolt projection for safe engagement should be at least two pitches beyond the last coil of the insert.

Tang Removal

To achieve the optimum bolt engagement and hence maximum strength, the tang should be removed from the insert. Exceptions to this recommendation may be necessary in certain blind-hole applications involving light tensile bolt loading.

Assembly Design

Design Method

The ultimate consideration is to design an assembly that balances the tensile strength of the bolt material against the shear strength of the parent material. With insert lengths available in 1, 1-1/2, 2, 2-1/2, and 3 times the nominal thread diameters, there are engagement lengths available to produce an assembly thread system where the bolt will fail without damage to the parent material or thread. The bolt must be fully engaged along the entire length of the insert to obtain this position.

Selection of the correct length insert can be determined from Table 1 referring to values for bolt ultimate strengths and parent material shear strengths. For intermediate strength value, use the next higher bolt tensile value or the next lower parent material shear strength.

Assembly strength is a function of shear area and the shear strength of the parent material, tensile strength and cross sectional area of the bolt. Table 1 provides a recommendation of the nominal length of insert which should be selected for a parent material of a certain shear strength, so that when a bolt is used with defined tensile properties, tensile failure of the bolt should occur before the insert is stripped away from the material in which it was inserted.

Design Method

The following procedure can be used to verify a joint design incorporating a wire thread insert:

1. Select size and strength of bolt to be used (refer to table 2).
 2. Determine tensile failure load of the selected bolt
 3. Determine shear strength of parent material for the installation of the insert (refer to table 3).
 4. Determine length of insert based on the shear strength capability of parent material.
- Note: Information in referring to joint strength is intended as a guide only. Professional engineering advice must be sought when exact design calculations are required.**

Table 1 (Source BS 7752: Part 1:1994)

TENSILE STRENGTH OF BOLT SELECTED (Ultimate Tensile Strength)						
SHEAR STRENGTH PARENT MATERIAL	400 (MPa) 58,000 (psi)	500 (MPa) 72,000 (psi)	600 (MPa) 87,000 (psi)	800 (MPa) 116,000 (psi)	1000 (MPa) 145,000 (psi)	1200 (MPa) 174,000 (psi)
70 to 99 MPa (10.0 to 14.4 Ksi)	2.0D	2.5D	2.5D	-	-	-
100 to 149 MPa (14.5 to 21.5 Ksi)	1.5D	1.5D	2.0D	3.0D	-	-
150 to 199 MPa (21.7 to 28.9 Ksi)	1.0D	1.5D	1.5D	2.0D	2.5D	3.0D
200 to 249 MPa (29.0 to 36.1 Ksi)	1.0D	1.0D	1.0D	1.5D	2.0D	2.5D
250 to 299 MPa (36.2 to 43.3 Ksi)	1.0D	1.0D	1.0D	1.5D	1.5D	2.0D
300 to 349 MPa (43.5 to 50.6 Ksi) >350 MPa (50.7 Ksi)	1.0D	1.0D	1.0D	1.0D	1.5D	1.5D
	1.0D	1.0D	1.0D	1.0D	1.0D	1.5D

Note: Inserts are available in different lengths which are measured by the diameter of the thread. For example the length of a 3D insert would be three times the diameter.

Note: Table 1 is for guidance only. It remains the responsibility of the user to ensure that the insert nominal length chosen is suitable for the particular application concerned.

Assembly Design

Shear strength of standard parent materials, (indication only refer supplier for specific properties)

+Nearest British Equivalent

#Nearest US Equivalent

Assembly Design

Step Four,

Determine the length of insert based on shear strength of parent material

Nominal Diameter	16.0 mm (selected bolt)	Nominal Diameter	0.500" (selected bolt)
Pitch	2.0 mm	TPI	13
Pitch Diameter (min)	17.299mm (refer tapped hole data)	Pitch Diameter (min)	0.550" (refer tapped hole data)

$$L = \frac{\text{Tensile Strength of Bolt}}{\text{Shear Circumference Strength of Hole} \times \text{Arbitrary Constant}}$$

L = Required length of fitted insert

Arbitrary Constant = 0.5

(0.5 Based on shearing of the parent material occurring along the pitch diameter of the tapped hole)

$$L = \frac{1034 \times (13.797 \times \pi / 4)}{283 \times 17.299 \pi \times 0.5}$$
$$L = 20.1 \text{ mm}$$

Conclusion:

For this application a 16mm diameter bolt has been selected. Insert engagement of 20.1mm was calculated. The suitable diameter of the insert can be determined by dividing the length of the insert by the diameter of the bolt.

For example:

$$\frac{L}{\text{dia}} = \frac{20.1 \text{ mm}}{16 \text{ mm}} = 1.26 \text{ select next highest size}$$

Therefore use a 1.5D insert

$$L = \frac{\text{Tensile Strength of Bolt}}{\text{Shear Circumference Strength of Hole} \times \text{Arbitrary Constant}}$$

L = Required length of fitted insert

Arbitrary Constant = 0.5

(0.5 Based on shearing of the parent material occurring along the pitch diameter of the tapped hole)

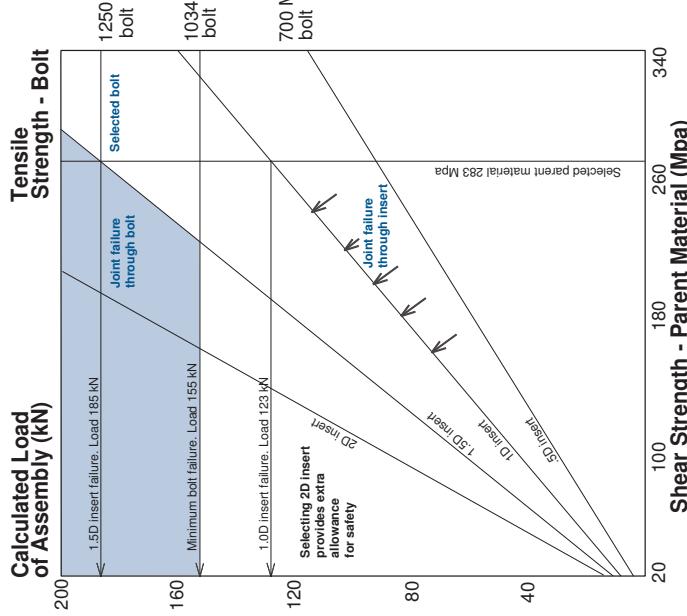

$$L = \frac{181,000 \times (0.407 \times \pi / 4)}{25,000 \times 0.550 \pi \times 0.5}$$
$$L = 1.09"$$

Conclusion:

For this application a 1/2" diameter bolt has been selected. Insert engagement of 1.09" was calculated. The suitable diameter of the insert can be determined by dividing the length of the insert by the diameter of the bolt.

For example:
 $\frac{L}{\text{dia}} = \frac{1.09"}{0.5"} = 2.2 \text{ select next highest size}$
Therefore use a 2.5D insert

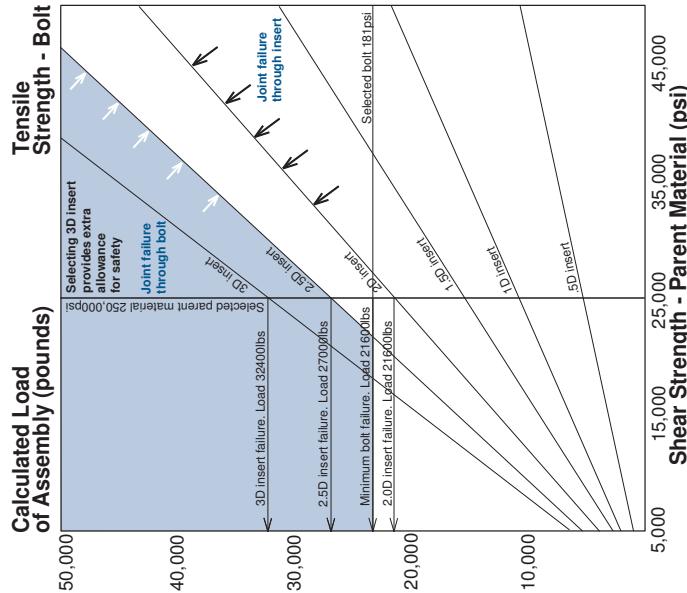

Assembly Design

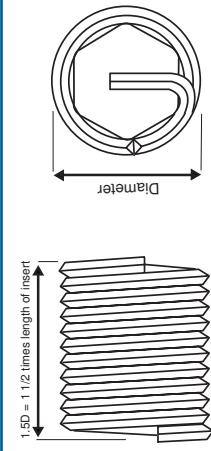

The shaded area in the graph indicates the region in which bolt failure will occur.

Note: Inserts are available in standard lengths which are multiples of the diameter. For example an insert with a length of 1.5D will measure one and a half times as long as the diameter when installed.

Note: The example above is an indication only. Professional engineering advice must be sought when exact design calculations are required.

The shaded area in the graph indicates the region in which bolt failure will occur.

*Nominal diameters for BSP and NPT are not thread diameters but relate to the inside diameter of the pipe.

Thread Identification

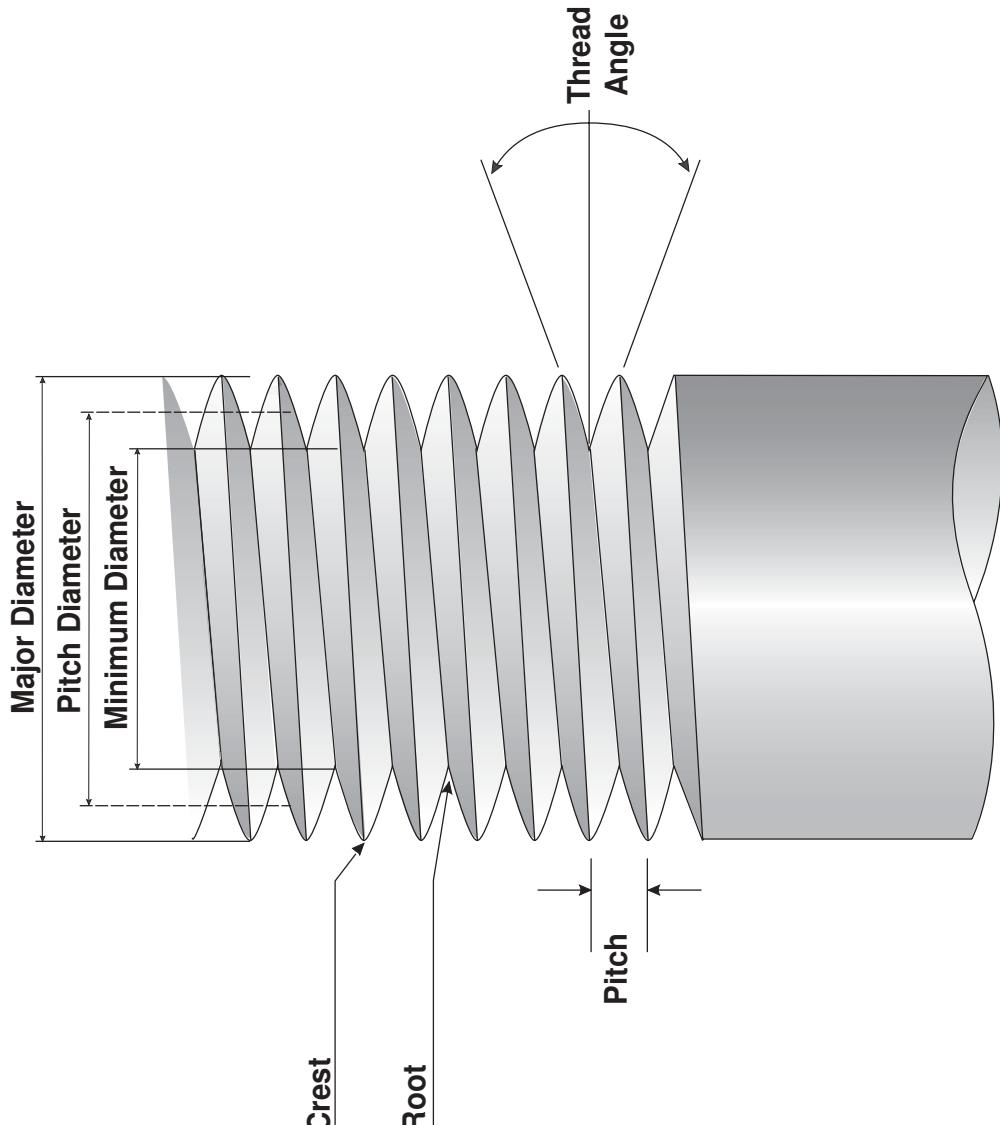

Screw Pitch Gauge

It is critical that inserts match the tapped hole exactly as some inch and metric are very close but only one is exactly right. A screw pitch gauge is the perfect tool to identify exact TPI or pitch. The bolt diameter should be measured and matched to the closest size over, relating to the TPI or pitch of the thread.

In general, major diameter of bolt or male thread will always be slightly less than the exact diameter listed in the thread identification and drill chart.

Thread Features

Drill Sizes

Drill sizes are recommended only. The nearest standard size drill above or below is generally quite suitable for repairs and in many instances, drilling is not necessary for stripped holes. For precision tolerances, the thread identification and drill chart is an accurate guide, but final size depends on material and machining conditions.

In practice BSW interchanges with UNC except at 3/16" and 1/2", SAE interchanges with UNF, except 1" UNF - 12 TPI, SAE - 14 TPI.

Complete Thread Fastener Systems

Keyserts

Keyserts from Alcoa Fastening Systems provide an easy-to-install thread assembly to replace damaged, stripped or worn threads in a wide range of materials including castings, forgings and mechanical components (except cast iron or sintered materials).

Made from tough high quality carbon steel or stainless steel, Keyserts are especially suitable for use in heavy wear and high vibration situations such as mining and earth moving equipment.

Keyserts are available in lightweight, heavy duty, extra heavy duty and solid types in metric and imperial thread forms. Each Keysert features either three or four locking keys providing a positive mechanical lock and preventing rotation and torsion. Whatever the project, Keyserts are renowned for reliability under the toughest conditions.

Recoil Wire Thread Inserts

Designed to be slightly oversized, these helically coiled inserts compress as they are inserted into the prepared hole to achieve maximum surface contact with the parent material.

Recoil Thread Repair Kits

Recoil thread repair kits contain a quality HSS tap, installation tool, precision stainless steel inserts, and instructions, in a sturdy reusable container. Recoil has a full range of problem-solving repair kits available in single or multiple size format.

* Maximum bolt projection "K" applies to locking inserts only. It is the minimum distance that the first full thread of the bolt must project to ensure accurate thread engagement with the lower locking coils when the assembly is completed.

** Maximum bolt projection "K" applies when the tang is not removed. When the tang is removed in a blind hole, the maximum bolt projection must not exceed the minimum drill depth.

Countersinking: It is recommended that a 120° countersink is provided before tapping to prevent a 'feather edge' at the start of the lead thread. When design prevents the use of a countersink, any feather edges or deformed material at the thread lead should be removed before tapping. This will facilitate insert installation and reduce the effects of removing the countersinking operation.

Drilling Depth: The minimum drilling depth "S" allows for one pitch chip clearance between the tip of the tap and the bottom of the drilled hole. "S" minimum allows for tap clearance, the maximum amount of insert set-down and the countersink. Where a spiral point tap is used, the drill depths shown should be increased to allow for chip clearance.

Fitted Insert: R = Maximum length of engaged portion of screw when tang is removed. Q = Minimum full tapped thread length. T = Minimum tapping depth – including 3 1/2 thread of plus tap. S = Minimum drill depth – excluding point.

*Minimum drill depth for a bottoming tap equals .313 plus the insert nominal length; for intermediate taps it equals .688 plus the insert nominal length. These drilling depths allow approximately 1/2 pitch tap end clearance. Minimum full thread tapping depth equals insert nominal length. The tapped hole will accommodate an insert installed 1/4 to 1/2 pitch below the surface of the tapped hole. When holes are to be countersunk, the drilling and tapping depths and insert installation depth should be increased 1/2 pitch. The recommended countersink is 120° included angle to the tap major diameter.

**The minimum and maximum drilled hole diameters listed are larger than standard to allow clearance for the major diameter of the mating threaded member. A drill size equal to the nominal thread diameter is suggested because it will generally produce an oversize hole with-in the tabulated drilled hole limits.

Drilling Depth: The minimum drilling depth "S" allows for one pitch chip clearance between the tip of the tap and the bottom of the drilled hole. "S" minimum allows for tap clearance, the maximum amount of insert set-down and the countersink. Where a spiral point tap is used, the drill depths shown should be increased to allow for chip clearance.

Fitted Insert: R = Maximum length of engaged portion of screw when tang is removed. Q = Minimum full tapped thread length. T = Minimum tapping depth - including 3 1/2 thread of plus tap. S = Minimum drill depth - excluding point.

Recoil brand threaded inserts, installation tooling, taps, gauges, and thread-repair kits accommodate a wide range of manufacturing and aftermarket applications in the automotive, aerospace, electronics, shipbuilding, defense, power-generation, and transportation industries. Offering a broad selection of sizes, materials, finishes, and coatings, Recoil inserts are manufactured in all of the popular thread forms

and in accordance with the world's most stringent quality standards, including AS9100, ISO9001, QS9000, and others. Competitively priced, these products deliver outstanding performance, durability, and value for thousands of uses. Alcoa Fastening Systems (AFS) also designs and manufactures non-standard Recoil inserts to meet special requirements.

Alcoa Fastening Systems Commercial Products: A Global Organization

Alcoa Fastening Systems maintains company offices in the United States and Canada, with offices in many other countries. Authorized AFS distributors are also
